Euroload Changeover Switches find a wide application scope wherever the reliability of electrical supply from the utilities is low and are used in lighting/motor circuits wherever continuity of supply is necessary, for switching to an alternative source from main supply and vice versa. They are switch disconnectors with independent manual operation capable of making, carrying and breaking currents under normal circuit conditions which may include operating overload conditions and also carrying currents under specified abnormal circuit conditions such as those of short circuit for a specified time. These switches are modular in construction, compact in size and suitable for stringent utilization category AC-23A/B.

## Range:

40A to 3150A in 7 frame sizes in 4 Pole

## Specifications:

IS13947-1 \& 3 / IEC 60947-1 \& 3.

## Features :

- Compact size, Quick make \& Quick Break mechanism.
- High electrical \& mechanical endurance.
- Enclosed housing to avoid dust ingress.
- Double break contacts per pole.
- Load and Line reversibility.
- Provision of Phase seperators, add-on auxiliary switch
- Door interlock and padlock facility, telescopic operating shaft.
- Extended outgoing terminals.

## Construction

Euroload Changeover switch has unique modular construction. The module comprises of two load switch disconnectors coupled together and mechanically interlocked with a common outgoing and operable by a single handle having I-O-II position.

The switching mechanism is quick make, quick break type
independent of the speed of the operation. There are four breaks per pole thereby resulting into faster quenching of arc. The load and line can be connected on either side by virtue of isolation on both the sides. The entire switching mechanism alongwith the fixed and moving contact assembly are housed in a nylon 66 FR grade, moulded frame/cover, having high dielectric strength \& thermal withstand capacity.

## Contact Mechanism

The contact mechanism is knife blade type with self cleaning action during operation. The fixed contact terminals in each phase have separate main and arcing contacts. The moving contact assembly has four sets of contacts on moving carrier and the entire assembly rests on three guides on moving carrier itself, which assists in its true movement during making and breaking.

The moving contact mates with the fixed contact by slide movement of the moving contact assembly. The contact is first made with the arcing contact and thereafter with the main contact. During breaking, the arc formation is across the arcing contacts thereby protecting the main contacts which results into enhanced life of the switch. The arc is effectively quenched \& confined in arc barrier in each phase.

The switches can be mounted inside a panel either in horizontal or vertical mode without any effect on the performance.

## Operating Mechanism

The operating mechanism consists of single side fron operated handle which drives the spring assisted toggle mechanism, inturn operating the switch. Position indication provided on front of switch, i.e. on the operating shaft.

In position 'l', supply I (Main) is connected to the load, supply Il is off.

In position 'O', supply I \& II are both disconnected from the load.

In position 'Il', supply II (Standby) is connected to the load, supply I is off.

Hence in none of the cases, supply I \& II are connected simultaneously.
